

Website Building: CRUD

JavaScript – TODO app

The following exercise contains the following subjects:

- ◆ CRUD

Instructions

Let's create a classic [CRUD](#) application.

We will create a TODO app but this code you can take along to any application the leverages CRUD. Including in React.

So it is very important that you master this. **Do not copy** a todo app online. You will only be cheating yourself.

Mandatory requirements:

- 1) Ability for the user to create a todo item.
- 2) Ability to display the todo items.
- 3) Ability to update a specific todo item
- 4) Ability to delete a todo item (todo item completed)

To have a fancy UI is not mandatory but recommended so you can proudly display this app in your github.

Extra Features (recommended to do)

- 1) Each todo item will show the specific date it was created
- 2) Prioritize the importance of each todo item.
- 3) any other cool features are welcomed!

Problem

We have a problem that we cannot persist our todo items. The minute we refresh the page all the data is erased.

We will find a solution tomorrow for this.

So make this app fully functional because tomorrow we will add more technologies to it, to make it a more functional app.

YALLA BALAGAN!

Submit the file to Hive.
