Front end development: Basics

JavaScript – Password Validation

The following exercise contains the following subjects:

◆ Ternaries
◆ Conditional Abuse

Instructions

Create a simple password validation function that takes a password string as an argument.

If the passwords length is more than **7** characters return "Strong". If it is less than **7** characters long return "Weak.

1) Create a function that uses a if/else conditional expression.

2. Create a function that uses a ternary conditional expression.

3. Create a function that uses a conditional abuse expression.

Create an "advanced" password validation function that takes a password string as an argument.

If the password length is more than **7** characters long and has at least one capital letter return "Very Strong".

If the password length in only **7** characters long return "Strong".

If the password length is less than **7** characters long return "Weak"

Use only a ternary conditional expression.

Submit the file to Hive.
